# Sample PHP Connect solution instructions

In order to start receiving events from your DocuSign account please follow the configuration in the *HTTPS Connect Guide* included in the DocuSign SDK.

PHP Connect solution contains just one project. The project consists of one PHP file and one sample data file. The data file can be used to test out the post processing.

Just like with a lot of PHP solutions deployment of the PHP sample is as simple as just copying the files into a directory on your server.

The sample has been tested with the following configuration:
-     PHP Version 5.2.6
-     cURL support: libcurl/7.15.5 OpenSSL/0.9.7l zlib/1.2.3

The url that you post the index.php can be used for both sending
**https://**<your_secure_server>**/**<somefolder>/**index.php**
